What Is a Torrent and How Does It Work?

A torrent is a file-sharing protocol that enables users to distribute data across the internet in a decentralized manner. Unlike traditional downloads that rely on a single server, torrents use peer-to-peer (P2P) technology, allowing multiple users to share pieces of a file simultaneously. This process makes downloading large files faster and more efficient, especially when many people are sharing the same content.

Torrenting typically requires a torrent client, such as BitTorrent or qBittorrent, which manages the download process. Users search for a torrent file or magnet link, initiate the download, and connect to other peers who have parts of the file. Popular content shared via torrents includes movies, music, software, and increasingly, books like "Can't Hurt Me."

- Peer-to-peer (P2P) technology
- Decentralized file sharing
- Use of torrent clients
- Common for large or popular files
